Docket No.: S0193.0011

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A method of preventing the external detection of operations in a digital integrated circuit comprising an asynchronous circuit,
comprising the method step of time-varying a supply voltage of said asynchronous circuit to time-shift the execution time of operations within said asynchronous circuit,
wherein the time variation of said supply voltage takes place in a random way.
2. (Canceled)
3. (Currently Amended) A digital integrated circuit comprising:
an asynchronous circuit, and
means for time-varying a supply voltage of said asynchronous circuit to time-shift the execution point of operations within said asynchronous circuit.
wherein said means for time-varying said supply voltage comprises a random number
generator.
4. (Canceled)
5. (Original) The digital integrated circuit according to claim 4, wherein said means for time-varying said supply voltage further comprises a noise voltage source driving said random-number generator.

Application No. 10/735,517 Amendment dated July 17, 2008 Reply to Office Action of June 6, 2008

6. (Currently Amended) The digital integrated circuit according to claim 43, wherein said means for time-varying said supply voltage further comprises a digital-analog converter

transforming the digital values produced by said random-number generator into an analog voltage.

7. (Original) The digital integrated circuit according to claim 3, wherein said means for time-varying said supply voltage further comprises a voltage regulator.

8. (Original) The digital integrated circuit according to claim 3, wherein said asynchronous circuit is formed for executing a coding algorithm.

9. (Previously Presented) The method according to claim 1, wherein the asynchronous circuit is a type which performs processing without correlation to a clock.

10. (Previously Presented) The digital integrated circuit according to claim 3, wherein the asynchronous circuit is a type which performs processing without correlation to a clock.
